

Dispersion series

~ Never to end ~

Daitopersion

Daitopersion is dispersion with Zinc Oxide or Titanium Dioxide which is developed by our surface treatment technology and dispersion technology. We suggest this series for sunscreen formulas.

Benefit of Daitopersion is low viscosity and superior stability thanks to low surface activity on powder coming from excellent surface treatment technology. In addition, it shows great transparency achieved by excellent dispersion technology and we expect high SPF value.

PASTE

PASTE is dispersion of oil and pigments. It is uniformly dispersed by our historical dispersion technology. High solid content and high viscosity are key point of this product and we suggest it for lip products and liquid foundation. It is very good handling ability and we introduce as a reliable product.

Water Dispersion

Water dispersion is a product with low viscosity and excellent stability developed by our know-how.

It makes easier to formulate mascara and eyeliner.

We have natural dispersion with Kishu Bincho-tan as well as dispersion with Titanium Dioxide, Iron Oxides and Carbon Black.
